Differentiation of Exponential and Logarithmic Functions

$\frac{d}{dx}(e^x)=e^x$	$\frac{d}{dx}(\ln x) = \frac{1}{x}$
$\frac{d}{d}(h^{x}) - h^{x} \ln h$	$\frac{d}{d}(\log x) = \frac{1}{d}$
$\frac{1}{dx}(D^{-}) = D^{-} \prod D^{-}$	$\frac{1}{dx}(\log_b x) - \frac{1}{x \ln b}$

 $f(x) = x^3 e^x$

 $f(x) = e^{x^2 + 1}$

$$f(x) = \frac{\ln x^3}{x}$$

 $f(x) = \ln \sqrt{2x^2 + 1}$

 $f(x) = 3^{5x+2}$

______ is a technique to help differentiate functions with many

products, quotients, and powers.

Ex 2.

Use logarithmic differentiation to find the derivative of the following function.

$$f(x) = \frac{\sqrt[4]{x+2}}{(1-2x)^3}$$

Practice

1. Differentiate:

$$f(x) = \frac{e^{5x}}{x+1}$$

 $f(x) = x \ln \sqrt{x^2 - 3}$

 $f(x) = \log_3(5x)$

2. Use logarithmic differentiation to find the derivative of the following function.

 $f(x) = x^2 e^{-3x} (2x+5)^5$
